

ABSTRACT

The invention relates to an item of jewelry comprising a support bezel (3) for stones or other decorative motif, characterised in that said support bezel (3) is overlapped by an ornamental piece (4) arranged to hide only certain parts (5) of the stones and/or decorative motif on the bezel. The above is provided with a means for pivoting about a vertical axis with respect to the support face of the bezel (3) and for the automatic locking thereof with each rotation of the piece (4). The above finds application in rings or similar.
